ADA Standards

This diagram outlines the accessibility and parking strategy for the project, aligning ADA and ICC A117.1 standards with the site's spatial constraints. The parking layout integrates accessible stalls directly along the primary street edge, ensuring proximity to entrances and continuous path-of-travel compliance. Based on the total number of parking spaces provided, the design meets and exceeds minimum requirements for ADA-accessible and van-accessible stalls, while also incorporating electric vehicle charging and bicycle parking to support alternative modes of transportation. The accessible stalls are paired with clear access aisles and direct connections to pedestrian routes, reinforcing both safety and usability. Rather than isolating accessibility as a code-driven layer, the system is embedded within the overall site organization, linking mobility, infrastructure, and public interface into a cohesive circulation framework that supports equitable access across the project.
