

D3

ADA W/C

This diagram outlines the ADA-compliant restroom layout, organized to ensure clear maneuverability, fixture accessibility, and efficient circulation within a compact footprint. The accessible stall is centrally positioned within the restroom, providing a **minimum 60-inch diameter** turning radius to allow full wheelchair rotation and ease of movement.

The water closet is located with a minimum 16 to 18 inches from the side wall to centerline, with a clear floor space of at least **60 inches wide and 56 inches deep for wall-mounted fixtures (59 inches for floor-mounted)**. Grab bars are positioned along the side and rear walls in accordance with ADA standards, supporting safe transfer and use.

Entry doors maintain a **minimum 32-inch** clear opening, with required maneuvering clearances provided on both pull and push sides to accommodate wheelchair approach. Circulation paths throughout the restroom maintain a minimum clear width of 36 inches, allowing continuous access to stalls and lavatories without obstruction.

Lavatories are designed with a **minimum 30 by 48 inch clear floor space for forward approach**, with knee clearance below and controls placed within accessible reach ranges. The layout aligns fixtures and clearances to avoid overlap conflicts, ensuring that all users can navigate, turn, and use the space independently.
