

E5 Building Standards

SUSTAINABILITY STRATEGIES (LEED-ALIGNED)

- On-site photovoltaic array generates approximately **180,000 kWh/year**, offsetting a significant portion of the building's operational energy and supporting base loads of the integrated data center
- Rainwater harvesting system captures up to **480,000 gallons** annually, reducing potable water demand and supplying non-potable systems
- Collected rainwater is reused for **toilet flushing, irrigation, and data center cooling**, lowering both water and energy consumption associated with mechanical systems
- Water-assisted cooling strategies reduce the energy demand of data infrastructure, addressing one of the most energy-intensive components of the building
- Use of **locally sourced stone (Manhattan schist)** minimizes transportation-related carbon emissions while reinforcing the project's material and geological identity
- Integrated environmental systems position the building as an **active energy and resource processor**, transforming solar exposure and rainfall into operational performance
