Program Narrative

The Hyperobject project is conceived as a hybrid cultural institution where media is not simply displayed but inhabited. The program layers immersive exhibition environments, a data center, public gathering spaces, service infrastructure, and dedicated media production facilities within a single faceted mass. Visitors encounter media as an environmental condition, projected, simulated, and networked, rather than as discrete objects behind glass. The conceptual framework positions the building as something simultaneously of the earth and deeply uncanny, mediating our relationship to ecology through data, simulation, and immersive spatial experience. The program reflects this: exhibition spaces are designed for large-scale projection and installation rather than conventional display, and a live data center embedded within the building provides the computational substrate for real-time media operations. Public spaces at grade establish the institution's civic presence and connect the building to the surrounding urban landscape.

- **Immersive exhibition:** environments, large-scale projection and installation spaces
- **Exhibition spaces:** rotating galleries for digital and physical media
- **Data center:** networked infrastructure supporting real-time media operations
- **Public spaces:** forum, lobby, and civic gathering at ground level
- **Services:** administration, mechanical, loading, and back-of-house support
- **Media infrastructure:** broadcast, recording, and production facilities
- **Circulation:** continuous spatial experience connecting all program layers
