

A5

Program Circulation

The circulation strategy is organized as a vertically integrated system that threads movement through the museum as a continuous spatial experience. Rectilinear volumes embedded within the mass act as vertical elevator cores, providing primary access between levels. These cores are paired with fire stairs to ensure code-compliant egress, with one core dedicated as a freight elevator to support back-of-house logistics and exhibition servicing.

Extending from these nodes, elongated linear elements operate as escalators, establishing a more gradual and experiential mode of vertical circulation. Together, elevators and escalators create a layered network of movement that allows for both efficient access and curated spatial progression.

At the center of the composition, a rock-like volume forms the immersive core installation, referred to as the “valley.” This space acts as both a visual and spatial anchor, horizontally connecting the surrounding worlds while reinforcing the museum’s concept of media as a continuous field rather than discrete rooms.

Circulation also links directly to infrastructural systems. Toward the upper right, the entry point to the underground parking is integrated into the overall network, allowing service and visitor access to feed seamlessly into the vertical circulation cores. The result is a tightly interwoven system where movement, program, and infrastructure operate as a single continuous framework.
